Abstract

This report discusses the first year of operation of a fuel cell power plant located at the Ocean County College, Toms River, New Jersey. PPL EnergyPlus, LLC installed the plant under a contract with Ocean County College. A DFC®300 fuel cell, manufactured by FuelCell Energy, Inc. of Danbury, CT was selected for the project.

The fuel cell successfully operated from January 1, 2004 to December 31, 2004. This report discusses the performance of the plant during this period.

Executive Summary

Ocean County College's decision to contract for use of a fuel cell at the college reflects the institution's commitment to managing energy costs, exercising environmental leadership, and leveraging innovative technologies to accomplish its energy and environmental goals. Ocean County College's director of facilities was interested in finding new energy cost reduction opportunities that could build on the institution's growing reputation for commitment to energy efficiency and environmental quality while exploring new technologies. This combination of goals positioned Ocean County College to value the prospect of installing a fuel cell as a demonstration project that could deliver on its commitment.

PPL EnergyPlus, LLC developed the project and Millennium Builders, a PPL company, was chosen as the general contractor for the project. PPL and Ocean County College worked very closely with Jersey Central Power and Light (JCP&L) and New Jersey Natural Gas (NJNG) Company to assure integration of the fuel cell with the local utilities.

The 250 kW molten carbonate fuel cell (MCFC) and its balance of plant is contained in an all-weather container located just outside the college's Instructional Building on a cement pad in a fenced-in 30 x 50 foot area in close proximity to the college's boiler and electrical rooms. Cables and piping bring power and hot water from the fuel cell into these interior control areas. The unit's electrical output is fed onto the college's main circuit while the hot water flows from the fuel cell to the college through a closed loop equipped with internal heat exchangers mounted on a custom skid in the boiler room. Fresh make-up water for the fuel cell's reverse osmosis equipment is piped separately from the boiler room out to the fuel cell.

The fuel cell operates in parallel with the local electric utility's distribution system that serves the general area. The interconnection design relies on the grid protection components that come as standard equipment in the FCE unit design.

Ultimately, the only substantive approval for the installation was for the parallel interconnection with the grid, provided by Jersey Central Power & Light. The utility had a well-defined set of interconnection requirements and procedures for units under 5 MW, and the approval process went smoothly and caused little delays. The primary liaison with PPL and the college was the utility's account representative. PPL and the college report that JCP&L was quite supportive of the project. The 60 percent reimbursement of installed costs was made through the New Jersey Clean Energy Fund, which is in turn funded through utility contributions. The Department of Energy provided an additional \$250,000 grant under the Department of Defense fuel cell buy down program.

PPL started testing the fuel cell on October 31, 2003. Final acceptance of the fuel cell was completed on December 21, 2003. Following several months of start-up activities, a high availability factor and few operating difficulties have marked operations during the first year.

1.0 Introduction

This report covers the first year of operation of a fuel cell power plant installed by PPL EnergyPlus, LLC (PPL) under a contract with Ocean County College and installed at the college in Toms River, New Jersey. The project had the support of the New Jersey Clean Energy Program and the Department of Energy (DOE). PPL selected FuelCell Energy, Inc. (FCE) and its fuel cell model DFC®300 for the contract.

Grant agreements were finalized, and a contract between PPL and Ocean County College for the manufacture, installation, and first year's maintenance of the fuel cell was executed on July 17, 2002. As the prime contractor, PPL was responsible for all facets of the project. All the work was completed by PPL through various subcontracts, including the primary subcontract with FCE for the manufacture, delivery, and installation of the fuel cell.

Final installation and field testing was completed December 18, 2003. Final acceptance of the fuel cell was completed on December 21, 2003. The fuel cell has operated for more than one year and continues to operate today.

2.0 Name, Address and Related Company Information

PPL EnergyPlus, LLC
Two North Ninth St., GENPL8
Allentown, PA 18101

PPL EnergyPlus LLC is PPL Corporation's competitive sales and marketing arm. PPL EnergyPlus buys and sells energy in competitive wholesale and deregulated retail markets, and provides energy solutions to business, industry, government and institutions. PPL's products and services include wholesale energy marketing, retail energy marketing, natural gas, distributed generation, mechanical services and energy demand reduction.

3.0 Production Capability of the Manufacturer

FuelCell Energy, Inc. (FCE) is the leading high temperature stationary fuel cell manufacturer and developer of molten carbonate and solid oxide applications. FCE's patented Direct FuelCell (DFC) technology combines high efficiency, low emissions, simplicity and economical cost for stationary power generation. FCE's DFC products are a very efficient and clean means of generating electricity using natural gas and other renewable gaseous fuels.

The fuel cell unit used in this project was a 250KW DFC 300A molten carbonate fuel cell supplied by FCE from its Torrington, Connecticut manufacturing facility. FCE is a world leader in the development and manufacture of high temperature hydrogen fuel cells for clean electric power generation. FCE is a leading fuel cell technology developer for over 30 years with more than \$450 million invested. FCE is headquartered in Danbury, CT with manufacturing facilities in Torrington, CT. FCE built its manufacturing operation with multiple purposes:

- Develop and refine the processes that will lead to large-scale manufacturing.
- Produce fuel cell components, stacks, and modules for commercial field trial by FCE and its partners.
- Produce fuel cells for FCE's ongoing R&D and improvement programs.

FCE's first manufacturing facility in Torrington, Connecticut began operations in 1992. On April 17, 2001 FCE unveiled a new 65,000 square foot manufacturing facility located in Torrington's Technology Park.

4.0 Experimental

This section is contained in the following information and in sections 5 through and including section 10.

DFC300 System Specifications

DFC® 300A

Certified to CARB 2007 Ultra Clean Emissions Standards

Dimensions

Height: 10.5'
Width: 9.0'
Length: 28.0'

Features / Benefits

250 kW net
Ultra clean energy
480 VAC, 50 or 60 Hz
Efficient
By-product heat availability
Easily sited
Modular and scalable
Quiet Operation
Internal fuel reforming
High-quality power
Few moving parts
Small package
Fuel-flexible

Plant Specifications

Power Output: 250 kW
Efficiency (LHV): 47 percent
Heat Rate: 7,260 Btu/kWh

Emissions

Nox: < 0.3 ppmv
Sox: <0.01 ppmv
CO: <10 ppmv
VOC: <10 ppmv

Available Heat

Exhaust Temperature: ≈650° F
Exhaust Flowrate: 3,000 lbs/hr
Exhaust Heat Available: 300,000 Btu/hr

FuelCell Energy, Inc. based in Danbury, Connecticut, developed and manufactures the above high temperature hydrogen fuel cell. FuelCell Energy has a range of products sized from 250 kW

to 2 MW, designed for a wide range of customers, including hospitals, universities, hotels, utilities and wastewater treatment facilities.

5.0 Principal Investigator

Ocean County College proactively sought out the project to implement its energy and environmental goals

6.0 Host Facility Information

Ocean County College
College Drive
Toms River, NJ 08754-2001

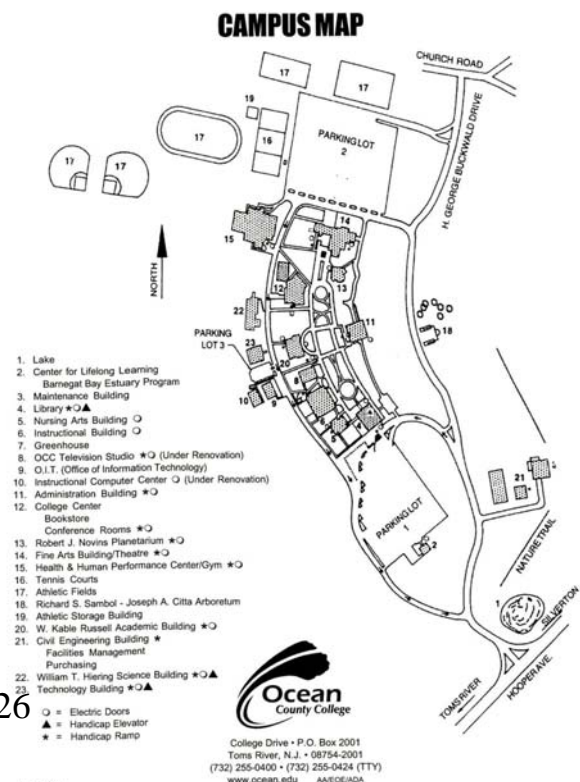

Ocean County College is a public two-year community college sponsored by Ocean County and the State of New Jersey and is accredited by the Commission on Higher Education, Middle States Association of Colleges & Schools. Ocean County College, founded over 35 years ago, currently has an enrollment of over 8,300 students.

New Jersey Natural Gas provides the college with natural gas and Jersey Central Power & Light is the college's electricity provider.

7.0 Fuel Cell Installation

The key milestones for the installation of the fuel cell were:

- Completion of major foundations for fuel cell, heat exchanger and transformer by September 29, 2003
- Fuel cell, heat exchanger and transformer to be shipped by September 30, 2003
- Fuel cell, heat exchanger and transformer to be set in place on October 1, 2003
- Completion of all mechanical and electrical work by October 16, 2003
- Commission natural gas meter on October 20, 2003
- Electrical relay test to be completed by October 20, 2003

Pre-installation work included: power monitoring, soil testing, natural gas testing and potable water testing. The PMK Group of Cranford, NJ was selected as the engineering design group. Millennium Builders of Rocky Hill, CT was selected as the general construction contractor. An on-site construction kickoff meeting was held on August 3, 2003. The fuel cell, heat exchanger and transformer were set in place on October 15, 2003. The equipment is located to the rear of the Instructional Building facing the street. There is a chain link fence around the equipment. Two options were considered for metering power consumption: 1) reverse power meter to meter electricity being fed back into the grid; or 2) meter power on every contactor in existing switchgear and a piece of gear to sum all the loads into one power consumption load. The second metering option was chosen. The existing water pressure in the Instructional Building was too low at 15 psig. A pump system/surge tank was added to boost the water pressure from 50 to 65 psig. New Jersey Natural Gas installed an underground gas line from the street directly to the fuel cell location where a regulator and meter was installed. The fuel cell uses natural gas at a pressure of 15 psig at a rate of 35 scfm. The customer decided on a two loop system design (hot water/glycol) for the heat exchanger. All piping and conduit were routed to the fuel cell underground.

The interconnection was completed by December 2, 2003 with commissioning and startup completed by December 21, 2003.

Some of the issues encountered during the installation phase were:

- The mini-pilings were out of tolerance in some locations. This was resolved by the contractor widening the grade beams and adding more rebar into the grade beams. The cost incurred for this change was borne by the contractor. This delayed the setting of the equipment onto the foundation to October 15, 2003.
- There were no permitting issues, significant or otherwise, involving the siting of the fuel cell.

Historical average monthly electrical use is illustrated in *Table 2—Monthly Site Parameters—2003*.

There were approximately 18 weeks of construction with anywhere from one to five contractor personnel onsite on any one day. Over the 18-week period it is estimated that there were approximately 1900 man hours.

The Ocean County College power plant operates in a cogeneration mode, supplying electricity and heat to several buildings on the campus. The unit is sited next to the Instructional Building and feeds power into the central power and heating system located in the basement. The power plant supplies about 80 percent of the daily power requirements for three buildings and 20 percent of the heating requirements for the college's central heating loop of seven buildings.

8.0 Electrical System

The 250-KW DFC 300A fuel cell power plant at Ocean County College is operated in parallel with the local Jersey Central Power & Light (JCP&L) electrical grid and is used as the primary power source for the site, with supplemental electricity purchases from JCP&L as necessary to meet total electrical demands. The fuel cell is electrically connected to the College's 480V system at the main switchgear bus in the Instructional Building, which is ultimately connected to the JCP&L power grid at the main electric meter for the site located in behind the Instructional Building. JCP&L had a standardized electrical interconnection for all distributed generation projects, such as this fuel cell, that were under 5 MW in capacity. The interconnection process went relatively smooth with a reasonable review and comment period from JCP&L on all interconnection issues and relay settings.

The DFC 300A electrical equipment contains a GE F-60 relay, which simplified the interconnection process as no additional relays, such as a reverse power relay, were required by JCP&L. As part of the interconnection application, PPL had to designate whether excess power from the fuel cells would be exported from the site. Ocean County College elected to obtain interconnection service from JCP&L that did not allow for export electric sales.

The DFC 300A fuel cell is designed to allow for connection to critical loads and operation in "backup" mode when the power grid is not available. Ocean County College did not connect any critical loads into the fuel cell during the first year of installation. The college is currently investigating options to connect critical loads such as its computer systems and emergency power into the fuel cell as the college is a designated evacuation site for the State of New Jersey.

9.0 Thermal Recovery System

Prior to this project, three natural gas fueled boilers provided the primary source of heating of the Instructional and six other buildings on campus. Heating loads were higher in the winter which required heat from at least two of the boilers and were reduced to one boiler in the summer which was used as a reheat boiler for the cooling system. As part of this project, the existing hot water loop system was extended to include the fuel cell's heat recovery unit (HRU). The exhaust from the fuel cell unit is ducted to a Cain hot water HRU to capture the thermal energy in the exhaust. The recoverable thermal energy from the DFC 300A fuel cell power plant can be up to 0.3 mmBTU per hour (mmBTU/hr). Therefore, the fuel cell heat recovery system is designed to provide 0.3 mmBTU/hr (216 mmBTU per month) of thermal energy in the form of hot water. A new below-grade hot water piping loop was interconnected to the existing hot water piping within the Instruction Building boiler room and a new duplex pump system (70 gpm) added to circulate the hot water through the fuel cell HRU. The fuel cell heat recovery system is designed for continuous operation to provide the primary source of heat for the water loop, supplemented by the three existing boilers. The fuel cell heat recovery system includes a bypass on the HRU to dissipate heat from the system in the event the fuel cell system is isolated from the College's hot water loop for any reason. This feature enables the fuel cell to continue full operation independent of the operation of the College's heat recovery system. The HRU utilize a cross-flow configuration with the high temperature exhaust gas passing over coils through which the water flows. In this configuration, relatively cooler water enters the HRU near the gas exit and exits at the front of the HRU near where the hot exhaust from the fuel cell enters the HRU. In this configuration, the temperature difference between the gaseous exhaust and the water in the hot loop remains relatively constant across the length of the HRU, thereby maximizing heat transfer from the gaseous exhaust to the water. Water temperature across the HRU and the radiator is measured through the use of multiple temperature sensors. The HRU system has run well during the first year of operation which substantially reduced the run time of the existing natural gas boiler system. This helped to save in both fuel and operational costs of the existing boilers.

10.0 Data Acquisition System

The DFC 300A fuel cell power plant is designed for unattended operation and is monitored remotely by FCE through a telephone connection to FCE's control center located in Danbury, Connecticut. Fuel cell operating parameters such as fuel usage, power output, water consumption, etc., are monitored by the power plant, with data stored locally and uploaded to FCE on a daily basis. The HRU skid is equipped with a meter that monitors continuous, cumulative and peak heat output as well as other thermal parameters. Ocean County College

maintenance personnel also visually inspect all aspect of the fuel cell system each day during their normal course of activities around the boiler room.

11.0 Results & Discussion

This section is included in sections 12 through and including 14.

12.0 Fuel Supply System

The fuel supply system for the fuel cell is designed for maximum flexibility. The fuel cell unit can operate on both pipeline-quality natural gas or biogas, if the biogas is properly cleaned up to FCE specifications. Natural gas is the primary fuel for this project at the college.

New Jersey Natural Gas, the local utility, ran a gas line capable of sending minimum 15 psi natural gas to the fuel cell. Having the proper pressure for natural gas available on-site was important and eliminated the need for a gas booster pump. The fuel cell uses a carbon bed, a de-sulphurizer and a humidification system to prepare the natural gas for introduction into the fuel cell. All these systems are provided by and delivered by FCE in the fuel cell container.

13.0 Program Costs

A breakdown of the actual project costs include the following items:

• System Purchase Cost	\$1,016,066
• Installation	\$544,858
• Thermal Recovery	\$76,100
• Performance Monitoring & Service Agreement	\$44,000
• Maintenance (labor, materials, etc.)	incl.
• Fixed Operating Cost	incl.
• Variable Operating Cost (\$/kWh)	incl.
• Fuel Costs (\$/Mbtu)	\$9.00
• Local Area Fuel Price	\$170,000
• Local Area Electricity Price (\$/KWh)	\$0.12
• Other Costs	
o Freight	\$17,000
o Commissioning/Start-up	incl.

The Performance Monitoring and Service Agreement from Fuel Cell Energy covers maintenance, fixed operating and variable operating costs. Maintenance includes items such as on site labor and material provided by Fuel Cell Energy. Fixed Operating Cost includes items such as 24/7 monitoring, 24/7 800 number help line, engineering upgrades to the fuel cell and scheduled maintenance such as filter and salt changes. Variable Operating Cost includes call-out and response by Fuel Cell Energy technicians for unplanned fuel cell outages.

14.0 Operational Data and Results

Ocean County College's electrical use during 2004 did not allow for full operation of the fuel cell at rated output during the fall, spring and winter months due to the campus load being less than 200 kW on an average day. A 400 ton chiller was operated in the summer time which increased the college's average load to over 300 kW during the summer months. For this reason, Ocean

County College chose to run the fuel cell at a reduced output (around 150 kW) during the non-summer months. The college is planning and is currently expanding its campus and will be seeking additional electrical loads to connect into the fuel cell to maintain its rated capacity throughout the year.

Although at a reduced load during the non-summer months, the fuel cell ran very consistently and at a very high availability factor (96%) as shown in the table below. The capacity factor for the fuel cell was 80% which was mainly due to the choice of running at a reduced output during the non-summer months of 2004.

The operating hours, total energy produced, peak and average electric output were derived directly from hourly fuel cell output data. The fuel usage was derived from actual utility bills. The thermal heat recovery numbers were based on sample data from the site and average expected thermal heat recovery based on the design of the HRU system. Electrical efficiency is supplied by the fuel cell manufacturer and thermal efficiency is derived from the thermal heat recovered / gas heat input value. The overall system efficiency shown is 59%.

Fuel Cell Operating Data

Rated Fuel Cell Capacity	250 kW	Fuel Usage (LHV)	18,942 MMBtus
Total Operating Hours	8,410 hrs	Thermal Heat Recovery	2,183 MMBtus
Total Time in Period	8,760 hrs	Heat Recovery Rate	200,000 Btus/hr
Availability	96%	Heat Rate	7260 LHV Btus/kWh
Total Energy Produced	1,637,278 kWe-hrs	Electrical Efficiency	47%
Average Electric Output	4,486 daily kWh	Thermal Efficiency	12%
Peak Electric Output	240 kW	Total Thermal Heat Recovery	11,086 MMBtus
Capacity Factor	80 %		

Table 1—Fuel Cell Operating Data

Prior to the installation of the fuel cell, Ocean County College purchased 100% of its electrical energy from the local electric utility and it purchased natural gas and produce hot water with its three boilers. The data below was derived from actual electric and gas utility bills.

Month 2003	Total Monthly Site Electrical Usage kWe-hrs	Peak Site Electrical Usage kW	Total Monthly Site Fuel Usage (LHV) MMBtu	Peak Site Fuel Usage (LHV) MMBtu/day
Jan	102,600	301	4,013	5.73
Feb	132,300	325	5,800	8.29
Mar	129,600	350	4,461	6.37
Apr	127,800	366	3,039	4.34
May	175,800	425	1,721	2.46
Jun	147,312	450	175	0.25
July	198,900	465	421	0.60
Aug	167,100	457	420	0.60
Sept	169,200	389	641	0.92
Oct	148,800	306	744	1.06
Nov	139,200	306	2,200	3.14
Dec	148,800	278	4,156	5.94

Table 2—Site Parameters Prior to Fuel Cell Installation—2003

After the installation of the 250 kW fuel cell, electric energy purchases from the local utility were reduced by over 1.6 million kWh and thermal energy generated by the boilers was reduced by over 2,000 MMBtus. Overall gas purchases from the local gas utility increased by 18,900 MMBtus in 2004 due to additional gas purchases for the fuel cell. The data below was derived from actual electric and gas bills. The Total Monthly Site Fuel Usage column summarizes the gas use at the Instructional Building and the fuel cell, which are separately metered.

Month 2004	Total Monthly Site Electrical Usage kWe-hrs	Peak Site Electrical Usage kW	Total Monthly Site Fuel Usage (LHV) MMBtu	Peak Site Fuel Usage (LHV) MMBtu/day
Jan	20,400	171	6,129	8.76
Feb	34,200	171	4,365	6.24
Mar	31,500	171	4,044	5.78
Apr	71,700	171	1,467	2.10
May	39,300	264	1,780	2.54
Jun	31,200	264	3,101	4.43
Jul	51,201	244	731	1.04
Aug	52,030	244	1,519	2.17
Sept	13,084	259	1,121	1.60
Oct	58,009	244	1,746	2.49
Nov	43,455	244	2,273	3.25
Dec	47,618	244	2,409	3.44

Table 3—Site Parameters During Fuel Cell Installation—2004

The site parameters that changed included a reduction in purchases from the local electric utility of over 1.6 million kWh which was offset by the power generated by the fuel cell. Natural gas purchased for the boiler house in the Instructional Building was reduced by over 2,100 MMBtus due to the thermal heat recovered from the fuel cell. The overall gas usage at the college was increased by over 18,900 MMBtus due to the natural gas needed to run the fuel cell.

The following table identifies the Mean Time Between Failure (MTBF), Total Scheduled Outages, Mean Time of Scheduled Outages, Total Unscheduled Outages, and Mean Time of Unscheduled Outages. The date, cause and duration of each outage that occurred during the first year of operation is provided in the second table below.

Fuel Cell Outages		
Mean Time Between Failure	371	hrs
Total Scheduled Outages	62	hrs
Mean Time of Scheduled Outages	341	hrs
Total Unscheduled Outages	288	hrs
Mean Time of Unscheduled Outages	408	hrs

Table 4—Fuel Cell Outages

The most common cause of the outages was grid interruptions from the local utility (designated as periods 14 through 22 on the chart below). Grid interruptions caused 126 hours of the total 350 hours of down time for the fuel cell in 2004. Grid disturbances may include local lighting storms, line switching, a pole accident or other unexplainable outages or fluctuations in the grid that cause the fuel cell to trip.

PPL EnergyPlus, LLC certifies that all the activities as noted in this report for the year 2004 are complete.

15.0 Milestones/Improvements/Lessons Learned

The fuel cell installation at Ocean County College had several milestones that were achieved during the first year of operation:

- First installation of a 250 kW fuel cell demonstration project at a public college in New Jersey
- A ribbon cutting ceremony to promote the installation of this leading edge technology with the local community and the state of New Jersey
- An integration of the fuel cell with several technical courses at the college by faculty so students can learn and better understand the many benefits of this technology for future
- One of the first demonstrations of a fuel cell at different load levels during each season to better match the actual energy use at the college (full output in the summer and partial output in the non-summer months)
- The first time pilings were used to stabilize the fuel cell pad as this fuel cell weighing 90,000 pounds had to be set on top of very sandy New Jersey soil

Several improvements and modifications PPL learned through this demonstration:

- The ability to use pilings to stabilize the heavy fuel cell in sandy, soft soil conditions
- The use of redundant pumps on the hot water loop from the heat exchanger to the boilers to improve overall system reliability
- The need to closely assess and monitor on site electric and thermal use for a potential fuel cell client to assure the fuel cell operates as efficiently as possible and while not back feeding into the power grid where wholesale power prices are extremely low and uneconomic compared to offsetting retail electricity purchases on site
- The use of a high speed broadband connection for quick, instant access to the fuel cell is much more useful than slower dial-up connections. This helps with monitoring and troubleshooting the fuel cell remotely and saves from the cost of sending out a technician unnecessarily

Several lessons learned from the installation of this demonstration project at Ocean County College include

- The need to meet very early in the process with local planning officials. Local townships are generally very receptive to a fuel cell installation when they understand what a fuel cell really does and that is a safe, reliable source of environmentally friendly power and heat. Having local informational meetings with local officials and members of the college board were very helpful.
- Siting the fuel cell near a location where power and heat can be readily connected into the college's utility system are key to a successful project. The fuel cell with the heat recovery unit occupies a relatively small area and the fuel cell is very quiet and clean which allows it to be sited very close to buildings.
- Installation costs can be reduced if land near the utility connections is available and is relatively clear from obstructions, both above and underground. The sandy soil at Ocean County College and the weight of the fuel cell caused PPL to install pilings under the fuel cell pad to assure long term foundational support. The overall close location of the fuel cell site to the Instructional Building boiler room greatly reduced installation costs which could have involved long electric and thermal pipe runs or significant ground work.
- Installation of the fuel cell also involves close coordination with all suppliers and local trades to assure success. The fuel cell project can easily run into cost overruns if the project is not managed properly.

- The operation of the fuel cell was spearheaded by FuelCell Energy, the fuel cell supplier. FCE entered into a service agreement with the college that allowed FCE to monitor the fuel cell 24 hours a day and dispatch technicians as needed for routine and non-routine maintenance. This was the best case scenario for the college who did not want to train its on-site maintenance personnel on how to operate the fuel cell. The fuel cell is complex power plant that needs special and ongoing training to assure successful operation.

16.0 Conclusions/Summary

Ocean County College partnered with PPL EnergyPlus to embark on this endeavor to install a 250 kW DFC300A fuel cell from FuelCell Energy. The success of this project was also support by the New Jersey Clean Energy Fund and the Department of Energy through the Department of Defense's fuel cell buy down program.

The college had three main goals for this project:

- Manage energy costs
- Exercise environmental leadership
- Leverage innovative technologies

All three goals were successfully met by through the installation of the fuel cell. Over 1.6 million kWh of electricity were generated and over 2,100 MMBtus of heat were recovered which offset natural gas purchased to create heat in its three boilers. The college was also able to extend the life of its boiler and reduce maintenance costs through the use of the heat from the fuel cell.

Ocean County also exercised environmental leadership by being the first public college in New Jersey to install a leading edge 250 kW molten carbonate fuel cell. This fuel cell represented the newest available fuel cell technology at the time and drew praise from the college's peers and local officials.

Finally, Ocean County College is leveraging this innovative technology by allowing faculty to integrate this topic into their classroom curriculum. Students of today are not just hearing about, but they are actually able to see, feel and hear an operating clean power source in their backyard on the campus.

This demonstration project was a true success to the college, students, community and to the promotion of fuel cell technology for generations to come.

The total fuel cell cost in 2004 was \$1,868,024 which includes installation, operations and fuel purchase.

17.0 References

None.

Appendix 1 – List of Acronyms and Abbreviations

BOP KW – load in kW of the balance of the plant
Btu. – British thermal unit
cbUnit – unit number, i.e. Unit 5 is Ocean County College
CO – carbon monoxide
COMBO64 – designation to show plant status
dc – direct current
DFC – Direct FuelCell
DOD – Department of Defense
DOE – Department of Energy
college – Ocean County College
EPM – Electric Power Meter
FC-217 PV – Process Value for Flow Control_217, used to regulate/measure natural gas flow
FCE – FuelCell Energy, Inc.
FS – Field Service
gpm – gallons per minute
GTAC – Global Technical Assistance Center
HMI – **HRU** – heat recovery unit
Hot s – Hot Standby
HSBT – typo in report should be HSBY
HSBY – Hot standby
Hz – Hertz
I&C – Instrumentation and controls
JCP&L – Jersey Central Power and Light
kW – kilowatts
kWe – kilowatt equivalent
kWh – kilowatts per hour
lb/hr. – pounds per hour
LHV – low heating value
MCFC – molten carbonate fuel cell
MMbtu – million British thermal units
MTBF – mean time between failure
MW – megawatts
N₂ – nitrogen
NJCEF – New Jersey Clean Energy Fund
NJNG – New Jersey Natural Gas
Nox – nitrous oxide
OCC – Ocean County College
Other D BOP – shows reading at balance of plant
OtherD CCB – shows reading at critical customer circuit breaker
OtherD Inverter – shows reading at inverter (Inverter=PCU, which is Power Condition Unit)
OtherD TB – shows reading at Tie Breaker
PC – personal computer
PCU AC KW – Gross power output in kW from inverter
Power opps – Power Operations
PPL – PPL EnergyPlus, LLC

ppmv – parts per million by volume
psig – pounds per square inch
pt – pressure transmitter
QSIA – conductivity meter
R&D – research and development
RO – reverse osmosis
scfm – standard cubic foot per minute
Sox – sulfur oxide
TBKW – Tie-breaker kilowatts
TD_0368 – incell differential temperature
TS&R – trouble shoot and repair
V – volt
VAC – volt alternative current
Voc – volatile organic compound
vs – versus
WTS – water treatment system
